RE: 324 N 15th Street, Milwaukee, WI

Mr. Breunig:

At your request, Spire Engineering, Inc. ("Spire") has analyzed the existing timber framing at 324 North 15th Street in Milwaukee, Wisconsin because of concerns over its capacity.

You had the wood species identified as Red Pine by the Forest Products Lab in Madison, Wisconsin. Then you hired Wood Science Consulting of Millbrook New York to advise us on design values to use for the Red Pine. Using those structural properties, we have analyzed the floor joists, beams and the roof for use as both residential and commercial. Per Section 1607 of the 2015 *International Building Code*, the design load for Residential use is 40 pounds per square foot; for Office use it is 65 psf; and for Retail it is 100 psf. Because the floors are very unlevel, we have added 15 psf of dead load for a system of Styrofoam and 2" of gypcrete for leveling the floors.

The building is L-shaped. The main north building area facing St Paul Ave is about 8,500 sf, and the southern portion is about 4,400 sf. The framing spans are different in the two areas, so there are separate calculations for each area. The floor joists are uniform in size on all floors, but the beam sizes get smaller as you go up higher in the building. Also, there was a fire on the south side of the building in about the year 2000. About half of the floor joists have been replaced with wood truss joists (TJIs). Visual grading of the original wood joists will still be done, but based on the knots in the beams, they will not be graded any higher than No 1, which is what we have used for our analysis. Additionally, there are water damaged beams and joists that will require further evaluation.

The results are:

<u>Use</u>	<u>North Side</u>	<u>Residential Use</u>	<u>Office Use</u>	<u>Snow Loads</u>
Floor joists		Pass	Pass	
1 st floor beams		Pass	Fail	
2 nd floor beams		Pass	Fail	
3 rd floor beams		Pass	Fail	
4 th floor beams		Pass	Fail	
Roof beams		n/a	n/a	Fail

<u>South Side</u>	<u>Residential Use</u>	<u>Office Use</u>	<u>Snow Loads</u>
Floor joists	Pass	Fail	
TJI floor joists	Pass	Fail	
3 rd floor beams	Pass	Fail	
4 th floor beams	Pass	Fail	
Roof beams	n/a	n/a	Fail

No areas of the building capable of supporting Office floor loads, including the areas rebuilt with TJI's after the fire on the south side of the building. All floors of the building are capable of supporting Residential use. At one time, the building probably was capable of supporting an office load using a historical value of 50 psf for Live Load instead of the current required loading of 65 psf (50 psf Live Load plus 15 psf for Partitions per Section 1607.5). All of the roof framing beams will need to be reinforced.

There are no floor design loads that are less than residential.

Sincerely,

Spire Engineering, Inc.

Alan T. Rentmeester, P.E.
President | Senior Structural Engineer

Dear Kendall Breunig,

Attached you will find our response regarding your submissions to the Wood Identification Public Service. Your specimen required more than the customary working time to identify.

Sincerely,

J. Rafael E. Arevalo B., PhD
Botanist-Collections Manager

Dear Kendall Breunig,

I have identified the specimen(s) you submitted to the Center for Wood Anatomy Research wood identification service. Your specimen(s) was/were received on 14-Feb-24 and identification(s) was/were completed on 14-Feb-24 the identification(s) is/are as follows:

1. *Pinus* sp. (Red Pine Group) 1st FLOOR BEAM
2. *Pinus* sp. (White Pine Group) BSMNT BEAM
3. *Pinus* sp. (Red Pine Group) JOISTS

Respectfully,

Alex C. Wiedenhoeft, Ph.D.

The [Forest Products Laboratory's website](#) has a wealth of information about a broad range of topics related to wood.

By submitting specimens for identification, you have accepted the [terms and conditions](#) of the wood identification public service.

Below are the preliminary base design values for the timbers and joists. What would be very helpful for me to know before I prepare a proposal is what grade does not work for the desired loading conditions. The values provided below are base design values, seasoning adjustments of up to 20% may be applicable for the Fb in the timbers based upon the current moisture content levels in the timbers and joists.

Design Values for Red and White Pine Timbers (5x5 and larger)

Visual Grade	F _b (psi)	F _t (psi)	F _v (psi)	F _{c//} (psi)	F _{c⊥} (psi)	E (psi)	SG ³
SS	1,050	625	130	725	440	1,100,000	0.44
No. 1	875	450	130	600	440	1,100,000	
No. 2	575	300	130	375	440	900,000	

Design Values for Red and White Pine 12" Deep Joists (2" to 4" thick)

Visual Grade	F _b (psi)	F _t (psi)	F _v (psi)	F _{c//} (psi)	F _{c⊥} (psi)	E (psi)	SG ³
SS	1,300	575	135	1,200	335	1,300,000	0.36
No. 1	875	400	135	1,050	335	1,200,000

- Deflection criteria: LL (L/480) and TL (L/240).
- Allowed moment does not reflect the adjustment for the beam stability factor.
- A structural analysis of the deck has not been performed.
- Deflection analysis is based on composite action with a single layer of 23/32" Weyerhaeuser Edge™ Panel (24" Span Rating) that is glued and nailed down.
- Additional considerations for the TJ-Pro™ Rating include: None.

Supports	Bearing Length			Loads to Supports (lbs)			Accessories
	Total	Available	Required	Dead	Floor Live	Factored	
1 - Stud wall - SPF	3.50"	2.25"	1.75"	410	469	879	1 1/4" Rim Board
2 - Stud wall - SPF	3.50"	2.25"	1.75"	410	469	879	1 1/4" Rim Board

* Rim Board is assumed to carry all loads applied directly above it, bypassing the member being designed.

Lateral Bracing	Bracing Intervals	Comments
Top Edge (Lu)	4' 10" o/c	
Bottom Edge (Lu)	17' 5" o/c	

- *TJI joists are only analyzed using Maximum Allowable bracing solutions.
- *Maximum allowable bracing intervals based on applied load.

Vertical Load	Location	Spacing	Dead (0.90)	Floor Live (1.00)	Comments
1 - Uniform (PSF)	0 to 17' 7"	16"	35.0	40.0	Default Load

CRITICAL LOAD COMBINATIONS:

Shear : LC #2 = D+L, V max = 8057, V design = 6463 lbs

Bending(+): LC #2 = D+L, M = 28457 lbs-ft

Deflection: LC #2 = D+L (live)

LC #2 = D+L (total)

D=dead L=live S=snow W=wind I=impact Lr=roof live Lc=concentrated E=earthquake

All LC's are listed in the Analysis output

Load combinations: ASCE 7-10 / IBC 2015

CALCULATIONS:

Deflection: EI = 4506e06 lb-in²

"Live" deflection = Deflection from all non-dead loads (live, wind, snow...)

Total Deflection = 1.50(Dead Load Deflection) + Live Load Deflection.

Design Notes:

- WoodWorks analysis and design are in accordance with the ICC International Building Code (IBC 2015), the National Design Specification (NDS 2015), and NDS Design Supplement.
- Please verify that the default deflection limits are appropriate for your application.
- Sawn lumber bending members shall be laterally supported according to the provisions of NDS Clause 4.4.1.
- FIRE RATING: Joists, wall studs, and multi-ply members are not rated for fire endurance.

E_{min}'	0.57 million	1.00	1.00	-	-	-	-	-	1.00	1.00	-	2

CRITICAL LOAD COMBINATIONS:

Shear : LC #2 = D+L, V max = 1069, V design = 923 lbs

Bending(+): LC #2 = D+L, M = 4073 lbs-ft

Deflection: LC #2 = D+L (live)

LC #2 = D+L (total)

D=dead L=live S=snow W=wind I=impact L_r=roof live L_c=concentrated E=earthquake

All LC's are listed in the Analysis output

Load combinations: ASCE 7-10 / IBC 2015

CALCULATIONS:

Deflection: EI = 436e06 lb-in²

"Live" deflection = Deflection from all non-dead loads (live, wind, snow...)

Total Deflection = 1.50(Dead Load Deflection) + Live Load Deflection.

Design Notes:

- WoodWorks analysis and design are in accordance with the ICC International Building Code (IBC 2015), the National Design Specification (NDS 2015), and NDS Design Supplement.
- Please verify that the default deflection limits are appropriate for your application.
- Sawn lumber bending members shall be laterally supported according to the provisions of NDS Clause 4.4.1.
- FIRE RATING: Joists, wall studs, and multi-ply members are not rated for fire endurance.

Joist_15.17ft (Res Loading)

Design Check Calculation Sheet
WoodWorks Sizer 11.1

Loads:

Load	Type	Distribution	Pat-tern	Location [ft] Start End	Magnitude Start End	Unit
Load1	Dead	Full Area			35.00 (1.33')	psf
Load2	Live	Full Area			40.00 (1.33')	psf
Self-weight	Dead	Full UDL			7.0	plf

Maximum Reactions (lbs), Bearing Capacities (lbs) and Bearing Lengths (in) :

Unfactored:			
Dead	409		409
Live	407		407
Factored:			
Total	817		817
Bearing:			
Capacity			
Beam	817		817
Support	1319		1319
Des ratio			
Beam	1.00		1.00
Support	0.62		0.62
Load comb	#2		#2
Length	0.68		0.68
Min req'd	0.68		0.68
Cb	1.00		1.00
Cb min	1.00		1.00
Cb support	1.14		1.14
Fcp sup	625		625

Special Lumber, Red&White, No.1, 2-3/4"x12", 1-ply

Supports: All - Timber-soft Beam, D.Fir-L No.2
Total length: 15'-3.35"; Clear span: 15'-2"; volume = 3.5 cu.ft.
Lateral support: top= full, bottom= at supports;

WARNING: Member length exceeds typical stock length of 0.0 [ft]

Analysis vs. Allowable Stress and Deflection using NDS 2015 :

Criterion	Analysis Value	Design Value	Unit	Analysis/Design
Shear	$f_v = 32$	$F_v' = 130$	psi	$f_v/F_v' = 0.25$
Bending(+)	$f_b = 563$	$F_b' = 875$	psi	$f_b/F_b' = 0.64$
Live Defl'n	$0.15 = < L/999$	$0.51 = L/360$	in	0.29
Total Defl'n	$0.37 = L/492$	$0.76 = L/240$	in	0.49
